

SMARTBRIDGE PROJECT SUBMISSION

PHASE 5 – Project Development

Auto Ticket Classification using Flow Designer

Project Details

Date: 29/09/2026

Team ID: 6ab4dd8ca238dc999eb5dd5c-Team ID

PHASE 5 – PROJECT DEVELOPMENT

Auto Ticket Classification using Flow Designer

Project Objective

The objective of this phase is to develop an automated ticket classification system using ServiceNow Flow Designer. The flow analyzes newly created incident/ticket details and automatically classifies or routes the ticket based on predefined conditions.

5.1 Development Environment

Component	Details
Platform	ServiceNow
Development Tool	Flow Designer
Main Record	Incident / Ticket
Automation	Flow Designer Flow
Classification Basis	Ticket category, short description and/or selected conditions

5.2 Flow Development

- **Step 1 – Create the Flow:** Open ServiceNow → All → Flow Designer → Create New → Flow.
- **Step 2 – Enter Flow Details:** Provide the flow name as “Auto Ticket Classification”. Add a suitable description.
- **Step 3 – Configure the Trigger:** Select the Incident/Ticket table and configure the flow to start when a new ticket is created.
- **Step 4 – Add Classification Logic:** Add If/Else or Decision logic to check ticket information such as category, short description, keywords, or other required fields.
- **Step 5 – Define Classification Rules:** Create conditions for different ticket types. For example, hardware-related descriptions can be classified as Hardware, software-related descriptions as Software, and network-related descriptions as Network.
- **Step 6 – Configure Actions:** Use Flow Designer actions to update the appropriate classification/category and, where required, assignment group or other ticket fields.
- **Step 7 – Save and Activate:** Save the flow, review the configuration, validate the flow, and activate it.
- **Step 8 – Create Test Tickets:** Create sample tickets representing each classification category and verify that the flow performs the expected update automatically.

5.3 Sample Classification Rules

Ticket Condition / Example	Classification
Hardware / printer / keyboard / system device	Hardware
Software / application / installation issue	Software
Network / Wi-Fi / connectivity issue	Network
Access / login / password related issue	Access / Account

5.4 Flow Structure

Trigger: Ticket/Incident Created → **Condition Check:** Read Ticket Details → **Decision:** Match Classification Rule → **Action:** Update Ticket Classification / Assignment → **End:** Ticket Saved with Updated Classification

5.5 Development Output

- A working Flow Designer flow named “Auto Ticket Classification”.
- Automatic classification based on configured ticket conditions.
- Automatic update of the selected ticket fields.
- Reduced manual effort in classifying incoming tickets.
- Consistent application of predefined classification rules.

5.6 Development Verification

After activation, sample tickets are created with different descriptions and categories. The resulting ticket records are checked to confirm that the expected classification is applied automatically. Any incorrect result is corrected by reviewing the trigger, conditions, decision logic, and actions in Flow Designer.

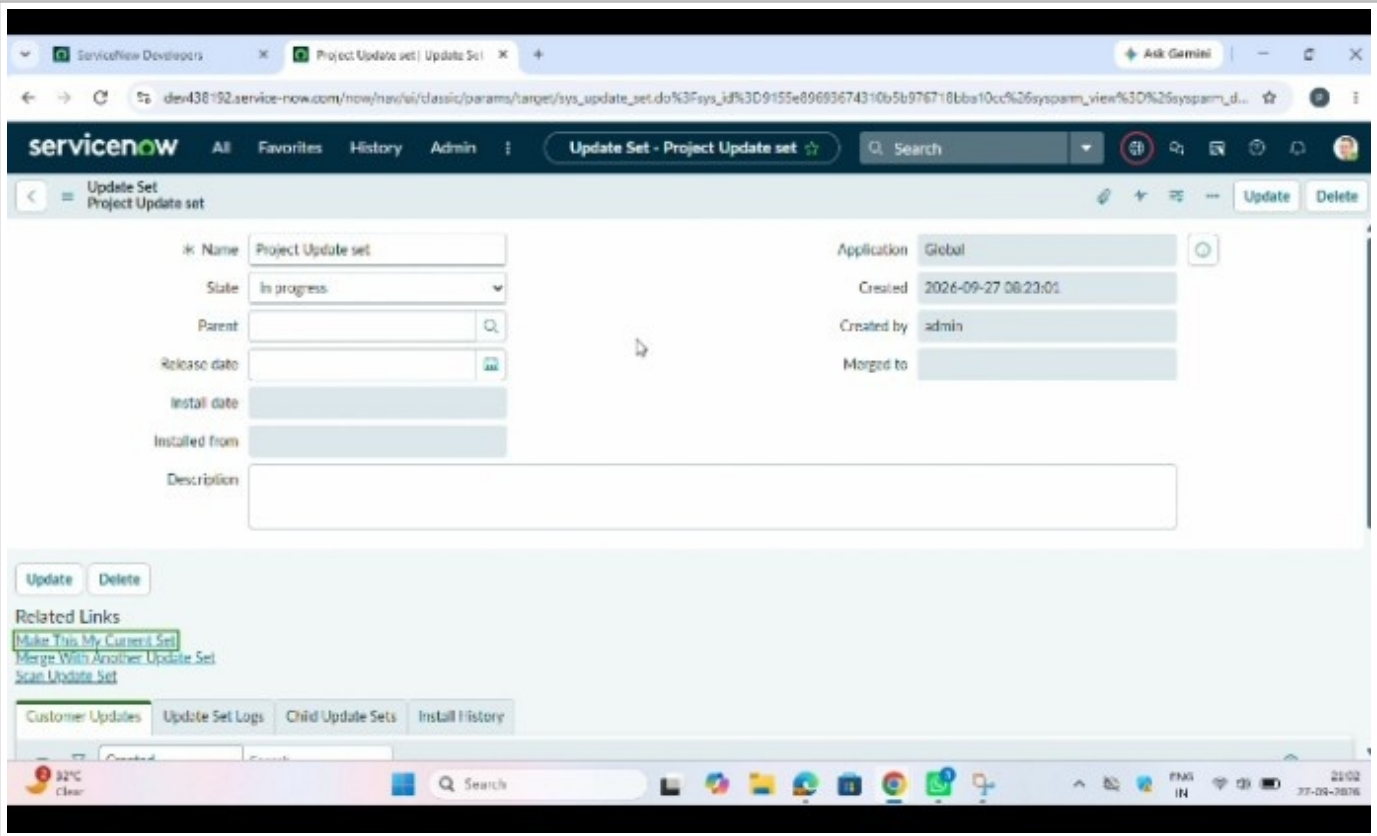

5.7 Phase 5 Completion Status

Activity	Status
Flow created	Completed
Trigger configured	Completed
Classification conditions configured	Completed
Actions configured	Completed
Flow activated	Completed
Sample tickets tested	Completed

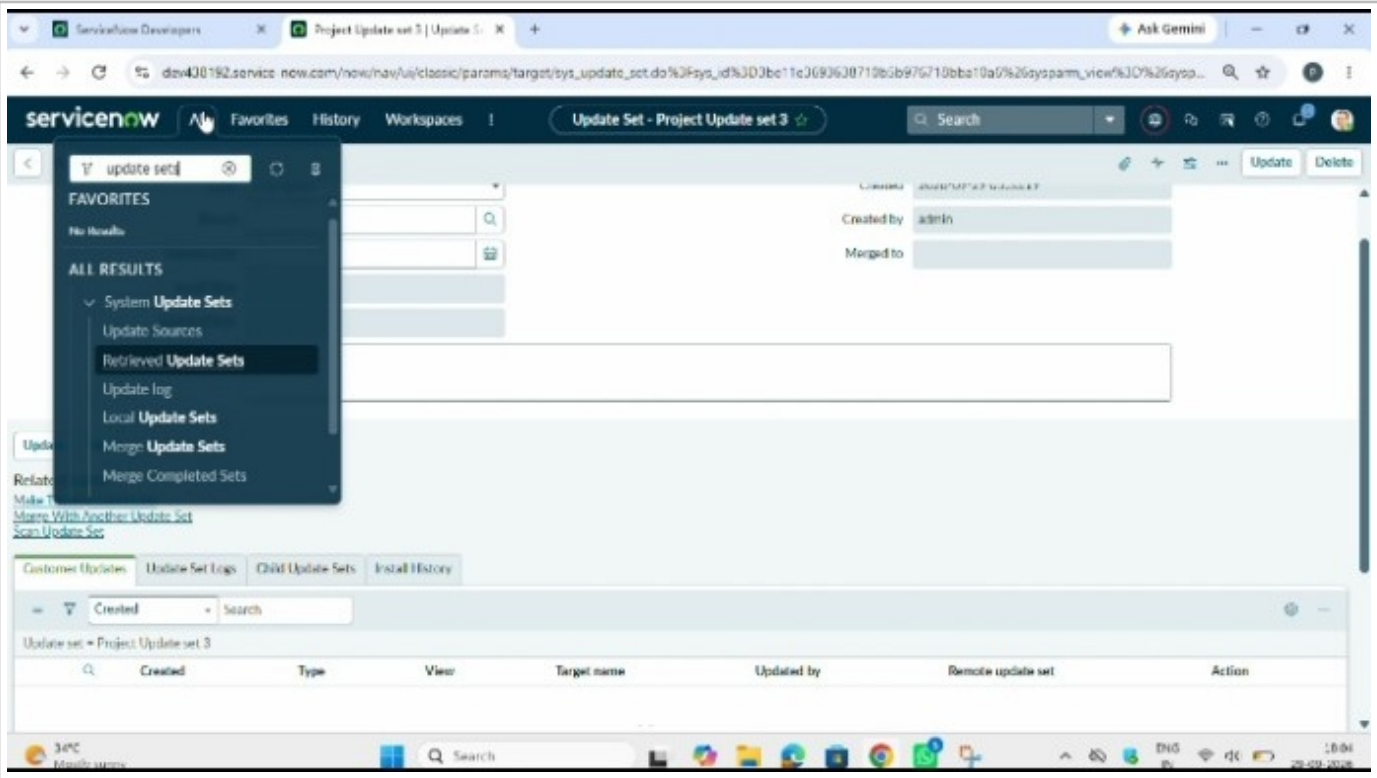

Note: Screenshots of the actual Flow Designer trigger, conditions, actions, flow execution, and classified ticket records should be added to the final project documentation as evidence of implementation.
