PROJECT DEVELOPMENT – PHASE 1

Brainstorming & Ideation Phase

Project Title: Auto Ticket Classification using FLOW DESIGNER

Phase: 1 – Brainstorming & Ideation

1. Introduction

The Brainstorming and Ideation phase is the first step of the project development process. In this phase, the project problem is identified, possible solutions are discussed, and the main idea of the project is finalized. The proposed project, **Auto Ticket Classification using FLOW DESIGNER**, aims to automate the classification of support tickets so that tickets can be organized and routed more efficiently.

2. Problem Identification

In a support system, users may create a large number of tickets for different issues such as technical problems, account issues, service requests, access problems, and general queries. Manually checking and classifying every ticket can take time and may lead to incorrect routing or delays. Therefore, an automated approach is needed to classify tickets based on their information and route them to the appropriate category or team.

3. Brainstorming of Ideas

Idea	Description
Automatic Ticket Classification	Automatically identify the category of a newly created ticket using predefined conditions and flow logic.
Keyword/Field-Based Classification	Use ticket fields or relevant words in the ticket information to determine the appropriate category.
Automatic Assignment	After classification, route or assign the ticket to the suitable team or group.
Status Automation	Update ticket status or related fields automatically according to the flow conditions.
Notification	Generate an appropriate notification or update when required after classification.

4. Proposed Solution

The proposed solution is to use **FLOW DESIGNER** to create an automated workflow for ticket classification. When a ticket is created or updated, the flow can check relevant ticket information, apply defined conditions, identify the required category, and perform the corresponding action. This reduces repetitive manual work and provides a structured process for handling support tickets.

5. Objectives of the Project

- To automate the classification of support tickets.
- To reduce the amount of manual effort required for ticket categorization.
- To improve the consistency of ticket classification.
- To route tickets to the appropriate category or support team.
- To create a simple and maintainable workflow using Flow Designer.
- To reduce delays caused by manual ticket handling.

6. Basic Idea / Workflow

Step	Process
1	Ticket is created or updated.
2	Flow Designer is triggered.
3	Relevant ticket information is checked.
4	Conditions/rules are evaluated.
5	Ticket category is identified.
6	Required classification/assignment action is performed.
7	Ticket is ready for further processing.

7. Expected Benefits

The expected benefits include faster ticket handling, reduced repetitive work, consistent classification, better organization of support requests, and improved workflow efficiency. Automation can also help support teams focus on resolving issues instead of manually categorizing every ticket.

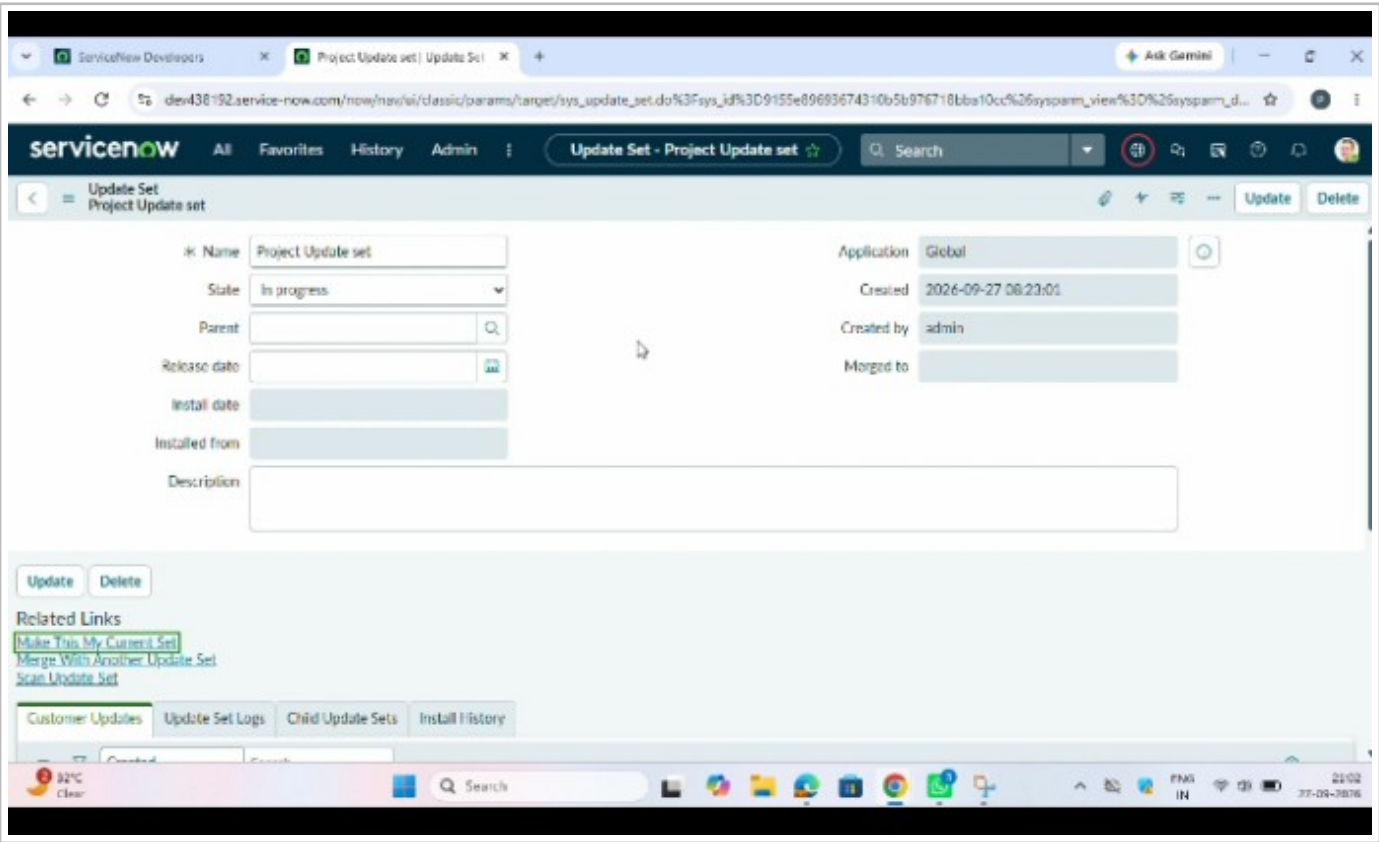

8. Conclusion

Through brainstorming and ideation, the project idea of **Auto Ticket Classification using FLOW DESIGNER** is established as an automation-based solution for organizing support tickets. The identified problem, proposed solution, objectives, and basic workflow provide a foundation for the next phase, **Requirement Analysis**.
