PROJECT DESIGN PHASE

Phase 3 – Project Design

Project Title	Auto Ticket Classification using Flow Designer
Phase	3 – Project Design Phase
Project Domain	IT Service Management / Workflow Automation
Design Focus	Automatic ticket categorization, routing and workflow automation

1. Design Overview

The proposed system is designed to automatically classify incoming IT support tickets and route them to the appropriate category, assignment group or workflow using Flow Designer. The design reduces manual classification effort, improves consistency, and enables faster ticket handling.

2. High-Level System Architecture

Layer	Component	Purpose
Input Layer	User / Employee	Creates or submits a support ticket with issue details.
Ticket Layer	Ticket Record	Stores ticket number, description, priority, requester and other fields.
Classification Layer	Classification Logic	Analyzes ticket information and determines the appropriate category.
Automation Layer	Flow Designer	Executes conditions, updates fields and routes the ticket automatically.
Assignment Layer	Assignment Group / Agent	Receives the classified ticket for further action.
Notification Layer	Email / System Notification	Notifies users or support teams about ticket updates.

3. System Workflow Design

Step	Process
1	User submits a new support ticket.
2	System captures ticket description and relevant ticket fields.
3	Flow Designer is triggered when the ticket is created or updated.
4	Classification rules inspect the issue details.
5	A suitable category/subcategory is selected.
6	The ticket is routed to the corresponding assignment group.

Step	Process
7	Priority or other required fields are updated according to defined rules.
8	Notification is generated when required.
9	Ticket is ready for agent processing and resolution.

4. Flow Designer Logic

Element	Design
Trigger	When a ticket/incident record is created or when selected ticket fields are updated.
Inputs	Ticket description, short description, service/category fields, priority and requester information.
Conditions	Keyword/rule-based conditions identify the likely ticket category.
Actions	Set category/subcategory, assign group, update priority and send notification where required.
Fallback	If no rule matches, keep the ticket in a default/general category and route it to the general support group for man

5. Functional Module Design

Module	Function
Ticket Intake	Accepts and stores incoming support requests.
Ticket Classification	Determines the appropriate category/subcategory based on ticket information.
Flow Automation	Runs the defined Flow Designer workflow automatically.
Assignment	Routes tickets to the relevant support group or agent.
Priority Management	Applies priority rules when required.
Notification	Sends system notifications for important workflow events.
Exception Handling	Provides a default path for tickets that do not match classification rules.

6. Data Design

Field	Description
Ticket Number	Unique identifier for the support ticket.
Short Description	Brief statement describing the reported issue.
Description	Detailed information provided by the requester.
Category	Main classification assigned by the automation.
Subcategory	More specific classification where applicable.
Priority	Indicates the urgency/importance of the ticket.
Assignment Group	Support team responsible for handling the ticket.
State	Current status of the ticket in its lifecycle.

7. Example Classification Rules

Ticket Content Example	Category	Possible Assignment Group
Password reset / login issue	Access / Account	Service Desk
Laptop / desktop not working	Hardware	Hardware Support
Application error / software issue	Software	Application Support
Network / Wi-Fi connectivity issue	Network	Network Support
Email delivery / mailbox issue	Email	Messaging Support

8. Non-Functional Design Considerations

- **Reliability:** The flow should handle normal and unexpected ticket inputs without interrupting ticket creation.

- **Maintainability:** Classification conditions should be organized so that new categories and rules can be added easily.
- **Performance:** Automation should complete classification and routing with minimal processing delay.
- **Security:** Only authorized users and support teams should access or modify ticket information.
- **Scalability:** The design should support increasing ticket volume and additional classification categories.
- **Auditability:** Important automated updates should be traceable through ticket history and workflow execution details.

9. Design Outcome

The Phase 3 design establishes the structure of the Auto Ticket Classification system. The design connects ticket intake, classification rules, Flow Designer automation, assignment, notification and exception handling into a single workflow. This design will be used as the basis for the Project Planning and Project Development phases.
