

SMARTBRIDGE PROJECT SUBMISSION

PHASE 6 – Project Testing

Auto Ticket Classification using Flow Designer

Project Details

Date: 29/09/2026

Team ID: 6ab4dd8ca238dc999eb5dd5c-Team ID

PHASE 6 – PROJECT TESTING

Auto Ticket Classification using Flow Designer

6.1 Introduction

The Project Testing phase verifies whether the Auto Ticket Classification flow works correctly according to the defined requirements. Different sample tickets are created and the classification results are checked to ensure that the Flow Designer automation performs the expected actions.

6.2 Testing Objectives

- Verify that the flow is triggered when a new ticket is created.
- Verify that ticket information is read correctly.
- Verify that the classification conditions work correctly.
- Verify that the correct category/classification is assigned.
- Verify that the flow does not incorrectly classify unrelated tickets.
- Verify that the final ticket record is updated successfully.

6.3 Test Cases

Test Case	Input / Ticket Example	Expected Result	Status
TC01	Printer not working	Classified as Hardware	Pass
TC02	Application installation issue	Classified as Software	Pass
TC03	Wi-Fi connectivity problem	Classified as Network	Pass
TC04	Unable to login / password issue	Classified as Access / Account	Pass
TC05	General ticket with no matching conditions	No incorrect classification; default handling applied	Pass
TC06	New incident created	Flow triggers automatically	Pass

6.4 Functional Testing

Functional testing is performed by creating sample incidents with different ticket descriptions. The Flow Designer checks the configured conditions and performs the corresponding action. The updated ticket is then reviewed to confirm that the classification is correct.

6.5 Validation of Flow Execution

- Confirm that the flow is active.
- Create a new test ticket.
- Check whether the trigger starts the flow.
- Verify the condition or decision branch selected by the flow.
- Verify that the required ticket field is updated.
- Review the final ticket record and flow execution details.

6.6 Error Handling

If a ticket is not classified correctly, the trigger, conditions, decision logic, and actions are reviewed. The flow is corrected and tested again. Tickets that do not match a predefined condition are handled using the configured default or no-match path.

6.7 Testing Result

The testing process confirms that the Auto Ticket Classification flow can automatically process sample tickets and apply the configured classification rules. The test cases are used to verify the trigger, decision logic, and ticket update actions.

6.8 Evidence to Add in Project Submission

- Screenshot of the Flow Designer flow.
- Screenshot of the configured trigger.
- Screenshot of classification conditions / decision logic.
- Screenshot of flow execution details.
- Screenshot of sample ticket before classification.
- Screenshot of the ticket after automatic classification.

Phase 6 Status: Project testing completed and classification flow validated using sample ticket scenarios.
