PHASE 7 – PROJECT DOCUMENTATION

Auto Ticket Classification using Flow Designer

7.1 Project Overview

Auto Ticket Classification using Flow Designer is a ServiceNow automation project designed to classify incoming tickets based on predefined rules. The project uses Flow Designer to trigger an automated workflow when a ticket is created and then process the ticket information to determine the appropriate classification.

7.2 Problem Statement

Manual ticket classification can require additional time and may result in inconsistent categorization. This project provides an automated approach for classifying tickets using predefined conditions in ServiceNow Flow Designer.

7.3 Project Objectives

- Automate the classification of incoming tickets.
- Reduce manual effort in ticket categorization.
- Apply consistent classification rules.
- Improve the initial routing and handling of tickets.
- Use ServiceNow Flow Designer to implement the automation.

7.4 Technologies and Tools Used

Component	Technology / Tool
Platform	ServiceNow
Automation Tool	Flow Designer
Main Record	Incident / Ticket
Workflow Logic	Trigger, Conditions, Decisions and Actions

7.5 System Workflow

Ticket Created → Flow Trigger → Read Ticket Details → Apply Classification Conditions → Select Matching Classification → Update Ticket → End

7.6 Classification Logic

Ticket Type / Example	Classification
Printer, keyboard, device related issue	Hardware
Application or software installation issue	Software
Wi-Fi or connectivity issue	Network
Login, password or access issue	Access / Account

7.7 Implementation Summary

- A Flow Designer flow was created for automatic ticket processing.

- The flow is triggered when a new ticket is created.
- Conditions and decision logic are used to identify the ticket type.
- Actions update the required ticket classification fields.
- The flow is activated and tested using sample tickets.

7.8 Testing Summary

Sample tickets representing hardware, software, network and access-related issues were used for testing. The flow execution and final ticket records were reviewed to verify that the configured classification rules were applied correctly.

7.9 Project Benefits

- Reduces repetitive manual classification work.
- Provides consistent ticket categorization.
- Supports faster initial ticket handling.
- Improves the use of ServiceNow automation.
- Makes the classification process easier to maintain using defined rules.

7.10 Future Enhancements

- Add more ticket categories and classification rules.
- Use advanced text or keyword-based classification.
- Automatically assign tickets to appropriate support groups.
- Add notifications for classified or high-priority tickets.
- Integrate additional ServiceNow automation and reporting features.

7.11 Conclusion

The Auto Ticket Classification using Flow Designer project demonstrates how ServiceNow Flow Designer can automate ticket classification. By using triggers, conditions, decisions and actions, the system provides a structured and consistent method for processing incoming tickets.

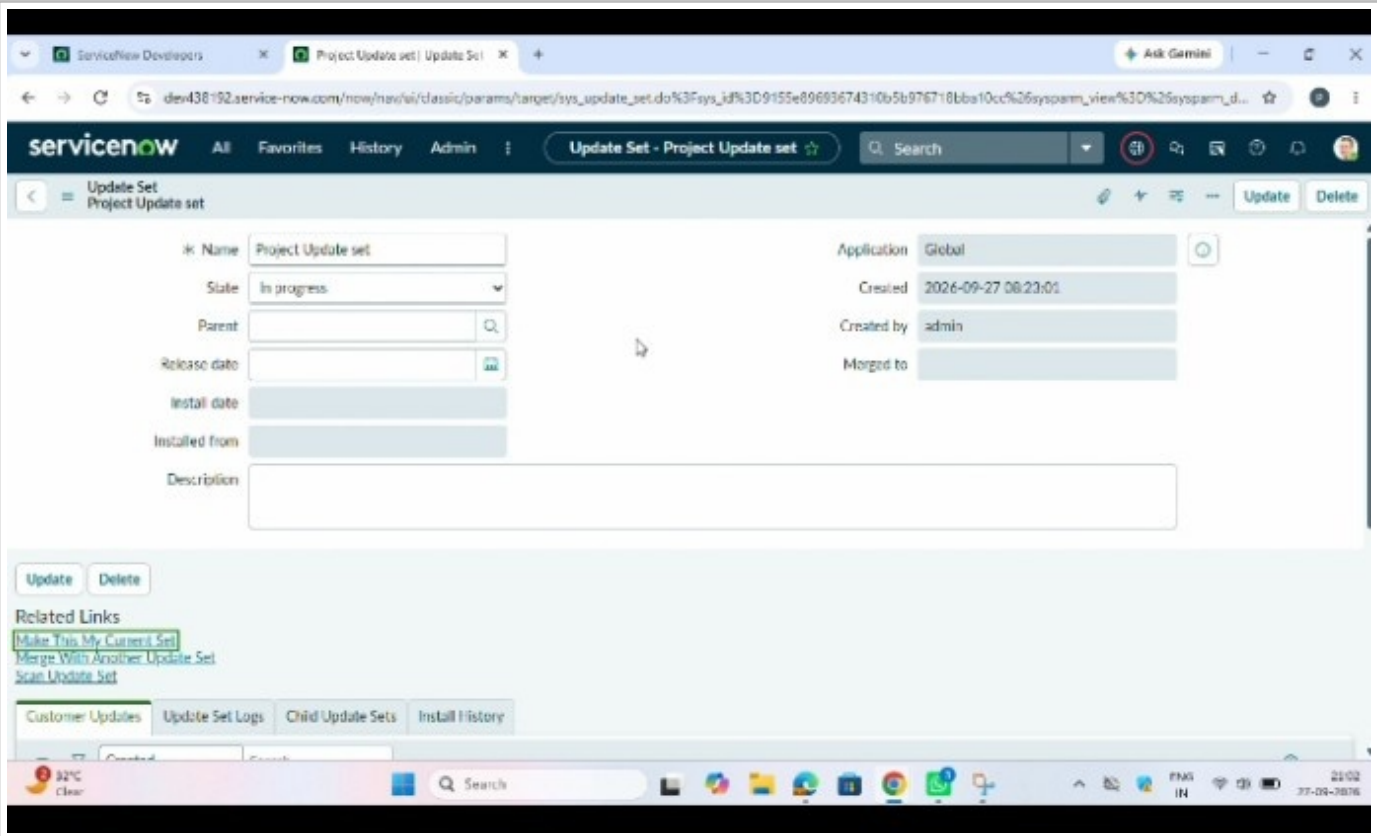

7.12 Documentation Evidence

- Project flow screenshot
- Trigger configuration screenshot
- Condition / decision configuration screenshot
- Flow execution screenshot
- Sample ticket before classification
- Sample ticket after classification
- Testing results screenshot

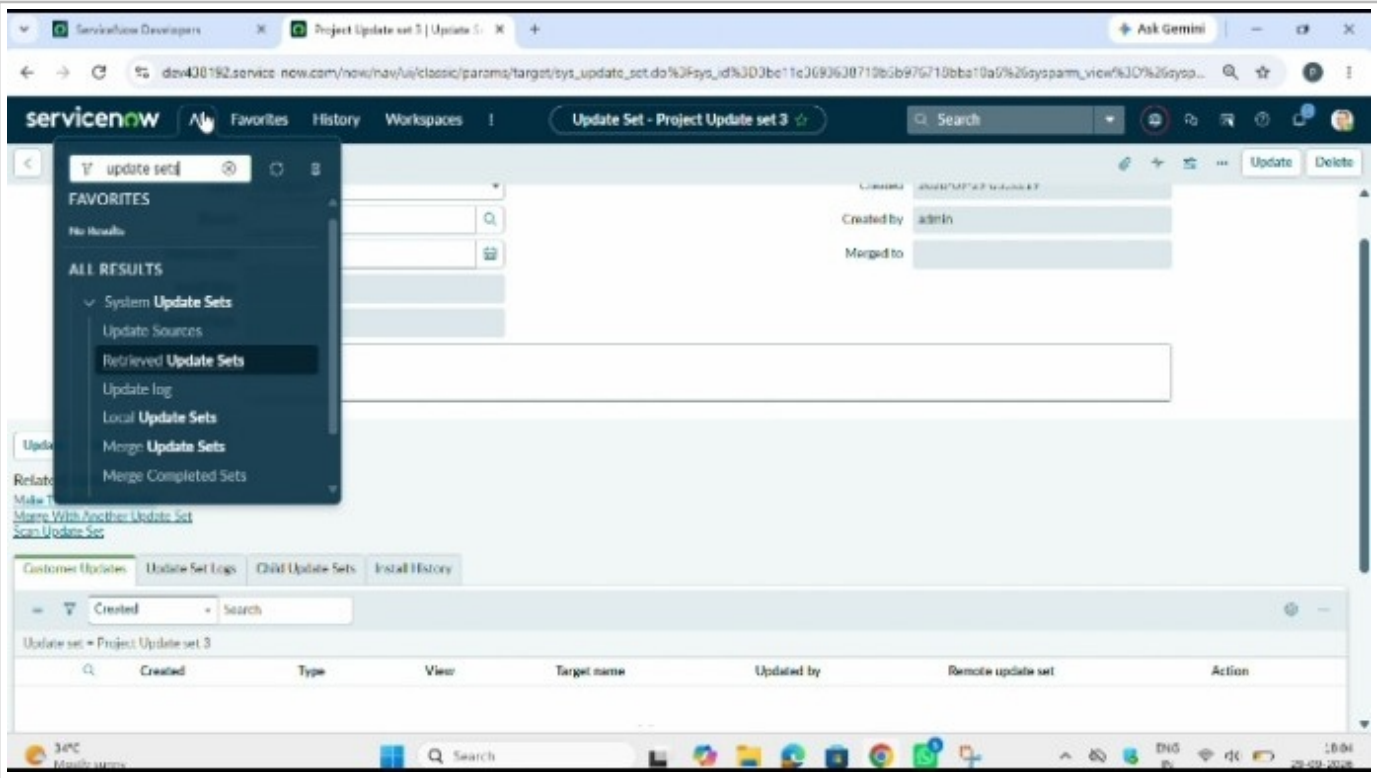

Phase 7 Status: Project documentation prepared for repository submission.
